

How the study works: measuring deployability, then the incentive that restores it

STAGE 1 — THE SCREEN: is a charging plan deployable?

repeat over every combination: behavior severity (0 / 5 / 20 / 45%) × capacity × grid × operator policy × seeds → ALL-PASS RATE

the all-pass rate collapses under small non-compliance

STAGE 2 — THE MECHANISM: why it collapses, and the lever that fixes it

Stage 1 is the deployability screen (this paper's method); Stage 2 is the game-theory layer that explains the collapse as a selfish equilibrium and identifies the compliance incentive that removes it.
